

When the key combination Fn+<something> doesnt work. increase brightness can be done by editing the file in backlight/acpi_video0/brightness

laptop_adjust_brightness

first search where the file is located

```
#find /sys -name backlight
```

On my computer it is at /sys/devices/virtual/backlight/acpi_video0/brightness

brightness is defined in range 0-15

```
#echo 15 > /sys/devices/virtual/backlight/acpi_video0/brightness
```

if you dont want screen to turn dark just set the file to read-only

```
#chmod -w /sys/devices/virtual/backlight/acpi_video0/brightness
```
