wget check web availability

use wget to check connectivity to a page.

Instead of typing address into a browser you can check website availability with wget command. With this you can decide to take some action when a web page is not available e.g. send email to admin.

```
wget --tries=3 --spider http://www.centos.orgk &>/dev/null
if [ "$?" != 0 ]; then
  echo "Website failed!"
else
  echo "website OK"
fi
```
